

Here's what a **proper stores system** should include — and why each feature actually matters in the real world:

1. 📦 Multi-Store Management

What it does:

Separate stores like:

- Kitchen Store
- Bar Store
- Housekeeping Store
- Maintenance Store

Why it matters:

Hotels don't operate from one storeroom. Without this, stock gets mixed up and accountability disappears.

2. 🔄 Stock Requisition System

What it does:

Departments (kitchen, housekeeping, bar) request items from stores.

Why it matters:

Prevents:

- Unauthorized stock usage
- "Things just disappearing"

Creates a clear paper trail.

3. 📦 Goods Receiving (GRN – Goods Received Notes)

What it does:

Records all deliveries from suppliers:

- Quantity received
- Condition

- Supplier details

Why it matters:

Stops fraud and supplier disputes. You can prove what was actually delivered.

4. Real-Time Stock Tracking

What it does:

Shows current stock levels at any time.

Why it matters:

- Avoids stockouts (no sugar for guests = embarrassment)
 - Prevents overstocking (wasted cash sitting on shelves)
-

5. Minimum Stock & Reorder Alerts

What it does:

Triggers alerts when stock falls below a set level.

Why it matters:

Hotels run daily operations — you can't "run out and buy later." This keeps everything flowing.

6. Cost Control & Stock Valuation

What it does:

Tracks:

- Purchase prices
- Total stock value
- Cost per department

Why it matters:

This is where profit is protected. Food, beverages, and consumables are major cost centers.

7. Issue & Consumption Tracking

What it does:

Records what stock is issued and to which department.

Why it matters:

Lets management answer:

- “Why is the kitchen using too much cooking oil?”
 - “Is housekeeping overusing supplies?”
-

8. Audit Trail & User Permissions**What it does:**

Tracks who did what in the system.

Why it matters:

- Reduces theft
 - Increases accountability
 - Essential for audits
-

9. Batch & Expiry Tracking (Very Important)**What it does:**

Tracks expiry dates for:

- Food
- Drinks
- Cleaning chemicals

Why it matters:

Expired items = health risk + financial loss.

10. Reporting Dashboard**What it does:**

Generates reports like:

- Stock movement

- Fast/slow-moving items
- Monthly consumption

Why it matters:

Management decisions should be data-driven, not guesswork.

11. 🤝 Supplier Management

What it does:

Stores supplier details, pricing history, and performance.

Why it matters:

Helps:

- Negotiate better prices
 - Avoid unreliable suppliers
-

12. 🔗 Integration with Other Hotel Systems

What it does:

Connects with:

- POS (restaurant/bar sales)
- Accounting system

Why it matters:

Stock should automatically reduce when a sale happens. Otherwise, your numbers lie.

Key System Components (Architecture View)

1. Authentication Service

- User roles: Admin, Storekeeper, Kitchen, Accounts

2. Inventory Engine

- Stock in/out logic
- Reorder calculations

3. Transaction Module

- GRN (Goods Received Notes)
- Requisitions
- Issues

4. Reporting Engine

- Generates reports (PDF/Excel)
-

Data Flow (How system actually works)

1. Supplier delivers goods
 2. Storekeeper records GRN
 3. Stock updates in database
 4. Department requests items
 5. Store approves & issues
 6. Stock reduces automatically
 7. Reports update in real time
-

Smart Add-ons (if you want to stand out)

- Barcode scanning (cheap USB scanners)
- Role-based dashboards
- Alerts (low stock, expiry)

- API for future mobile app
